Release notes — v2.0 🚀

> “Write in Markdown. Ship a PDF that looks typeset.”

mdfolio turns plain `.md` files into **print-quality PDFs** — locally, in seconds, with real typography.

What’s new ✨

- Three themes: *Light*, *Dark* and *Sepia* — the background prints full-bleed.
- Curly quotes and proper dashes – automatically.
- One click to export **without emojis** 🧹 for clients who hate them.
- Page numbers, A4 / Letter / Legal, adjustable margins.

Export formats

Format	Use it for
PDF	Clients, print, archive
PDF, no emojis	Formal documents
HTML	Web, email
TXT	Plain-text pipelines

Under the hood

```
import { mdToHtml } from "./converter.mjs";

const html = mdToHtml(markdown, { font: "Georgia", theme: "sepia" });
// Chromium headless prints it to PDF — no cloud, no account.
```

Why it exists 💡

Most Markdown-to-PDF tools give you either *ugly defaults* or a *LaTeX install*. mdfolio sits in between: drop a file, pick a typeface, export.
